## **A profile of patients receiving palliative care in Western Australia for January - June 2019**

### **Abstract**

The Palliative Care Outcomes Collaboration (PCOC) is a national program that aims to improve the quality and outcomes of palliative care in Australia. This is achieved via a standardised clinical language that supports a national data collection. This report provides a high level profile of 4,181 patients who received palliative care in Western Australia during July to December 2018 and had their pain, symptom, family / carer and psychological / spiritual issues assessed as part of routine clinical care.

# Introduction

The Palliative Care Outcomes Collaboration (PCOC) is a national program that aims to improve the quality and outcomes of palliative care in Australia. This is achieved via a standardised clinical language that supports a national data collection. This report provides a high level profile of 4,181 patients who received palliative care in Western Australia during July to December 2018 and had their pain, symptom, family / carer and psychological / spiritual issues assessed as part of routine clinical care.

For more detailed information, including a summary of the national achievement against PCOC's 20 benchmarked patient outcome measures, please see the companion report *Patient outcomes in palliative care in Western Australia, July – December 2018*.

## Patient characteristics

Table 1 describes the demographics of patients receiving palliative care.

Table 1 Patient demographic summary

Patient demographics		N	%
Sex	Male	2,148	51.4
	Female	2,032	48.6
Indigenous status	Aboriginal and/or Torres Strait Islander origin	72	1.7
	Not Aboriginal and/or Torres Strait Islander origin	3,981	95.2
Country of Birth	Born in Australia	2,377	56.9
	Born outside Australia	1,693	40.5
Preferred language	English	3,961	94.7
	Other than English	165	3.9
Primary diagnosis	Malignant	2,553	61.1
	Non-malignant	1,618	38.7
Age at beginning of episode	Average age	74.8	
	Median age	77.0	

Figure 1 Patients by sex and age group

## Diagnosis

Diagnosis reflects the primary illness responsible for the person requiring palliative care. These illnesses are classified as either malignant (cancer) or non-malignant (illnesses other than cancer). **Error! Reference source not found.** shows how the split between malignant and non-malignant has changed since 2016, whilst Figure 3 shows a more detailed breakdown of diagnoses for the current six-months.

Community palliative care service	7.5	6.7	7.4	5.9	6.4	5.0
Community generalist service	0.4	0.2	0.3	0.3	0.4	0.1
Residential aged care facility	8.0	7.5	9.1	10.9	13.3	14.8
Self, carer(s), family, friends	0.2	0.3	0.3	0.7	0.4	0.4
Other	0.6	0.9	2.1	1.6	1.3	0.8
Not stated/inadequately described	0.0	0.0	0.0	0.1	0.0	0.0
Total	100	100	100	100	100	100

Note: Only includes episodes that started during each six month reporting period.

Figure 4 Phase at beginning of episode

The most common first phase is

**deteriorating**

with an average duration of 8.5 days.

Figure 5 Phase at beginning of episode – over time

**Figure 6** Symptoms and problems at episode start

The patient rated symptom with the highest number of severe scores is pain (2.5%). The symptom causing the least distress is nausea, rated by patients as 'absent' 81.3% of the time.

**Figure 7** Moderate and severe problems at episode start over time (PCPSS)

**Figure 8** Moderate and severe symptoms distress at episode start over time (SAS)

## Palliative care phase

The palliative care phase type describes the stage of the patient's illness and provides a clinical indication of the level of care a patient requires. Table 3 describes the number of phases and phase length.

Table 3 Profile of palliative care phase

Phase type	N	%	Average phase length (days)
Stable	4,787	34.4	12.0
Unstable	770	5.5	1.5
Deteriorating	6,764	48.6	7.9
Terminal	1,595	11.5	3.0
All phases	13,916	100.0	8.4

Note: Phase records where phase length was greater than 90 days were considered to be atypical and are excluded from the average calculations.

The **deteriorating phase** is the most common  
with an average duration of 7.9 days.

Figure 9 Phase profile overtime

## Place of death

For January - June 2019, 1,749 patients died in the care of a specialist palliative care service. Of these deaths, 34.4% occurred at the persons home, 22.7% in a residential aged care facility and 42.8% in hospital.

## Data included

Table 4 Data item completion – January to June 2019

Patient level items	%
Date of birth	100.0
Sex	100.0
Indigenous status	96.9
Country of birth	97.3
Preferred language	98.7
Primary diagnosis	99.8

Referral date	100.0
Referral source	100.0
Date ready for care	100.0
Mode of episode start	100.0
Accommodation at episode start	100.0
Episode end date	92.7
Mode of episode end	100.0
Accommodation at episode end	99.9
Place of death	99.9
Phase level items	%
Phase end reason	100.0
Clinical assessments (completion at phase start / discharge)	%
RUG-ADL Bed mobility	99.8 / 68.9
RUG-ADL Toileting	99.8 / 68.9
RUG-ADL Transfers	99.7 / 68.9
RUG-ADL Eating	99.3 / 68.8
PCPSS Pain	99.9 / 69.0
PCPSS Other symptoms	96.1 / 67.0
PCPSS Psychological / spiritual	99.9 / 69.3
PCPSS Family / carer	94.9 / 60.1
SAS Difficulty sleeping	99.6 / 68.6
SAS Appetite problems	99.6 / 68.7
SAS Nausea	99.7 / 68.7
SAS Bowel problems	99.6 / 68.6
SAS Breathing problems	99.7 / 68.8
SAS fatigue	99.7 / 68.7
SAS Pain	99.8 / 68.8
AKPS	99.9 / 69.0

Table 5 Number of patients, episodes and phases over time

	Jul-Dec 2016	Jan-Jun 2017	Jul-Dec 2017	Jan-Jun 2018	Jul-Dec 2018	Jan-Jun 2019
Patients	3,379	3,314	3,522	3,595	3,813	4,181
Episodes	4,212	4,146	4,406	4,499	4,739	5,292
Phases	13,295	12,880	13,267	13,023	12,883	13,916
Average number of phases per episode*	2.9	2.9	2.7	2.6	2.5	2.4

\*Calculated for closed episodes that started and ended within the reporting period and excludes bereavement phases.

## Glossary

<b>AKPS</b>	The Australia-modified Karnofsky Performance Status (AKPS) is a measure of the patient's performance across the dimensions of activity, work and self-care at phase start. It is a single score between 10 and 100 assigned by a clinician based on observations of a patient's ability to perform common tasks relating to activity, work and self-care.
<b>Episode</b>	An episode of care is a period of contact between a patient and a palliative care service that is provided by one palliative care service and occurs in one setting. An episode of care ends when either; the patient is formally separated from the current setting of care; the patient dies; or the principal clinical intent of the care changes and the patient is no longer receiving palliative care. Under this definition, a patient receiving palliative care is likely to have more than one episode of care.
<b>Patient</b>	PCOC defines a patient as a person for whom a palliative care service accepts responsibility for assessment and/or treatment as evidenced by the existence of a medical record. Family / carers are included in this definition if interventions relating to them are recorded in the patient medical record. As a result, if a patient is seen in two different services with different medical record systems they will be counted twice in the total number of patients.
<b>PCPSS</b>	Palliative Care Problem Severity Score (PCPSS) is a clinical tool used for initial screening and ongoing coordination of specialist palliative care. Clinician rated, it facilitates the global assessment of four palliative care domains: pain, psychological / spiritual, other symptoms and family / carer.
<b>Phase</b>	Palliative care phase identifies a clinically meaningful period in a patient's condition. The palliative care phase is determined by a holistic clinical assessment which considers the needs of the patients and their family and carers. The phases provide a framework for referrals, triage and care planning.
<b>RUG-ADL</b>	Resource Utilisation Groups – Activities of Daily Living (RUG-ADL) consists of four items (bed mobility, toileting, transfers and eating) and assesses the level of functional dependence, based on what a person actually does, rather than what they are capable of doing.
<b>SAS</b>	Symptom Assessment Scale (SAS) describes the patient's level of distress relating to individual physical symptoms. The symptoms in the scale are the seven most commonly experienced by palliative patients; difficulty sleeping, appetite problems, nausea, bowel problems, breathing problems, fatigue and pain. The instrument is designed to be a patient rated tool but also allows for rating by proxy (e.g. family, carer or clinician).
